# Auto-formalization of genus-0 Gromov compactness pseudo-holomorphic curves in Lean 4

Pablo Suárez-Serrato

November 10, 2026

**Abstract**

We present a formalization of genus-zero Gromov compactness for pseudo-holomorphic curves in closed tame symplectic manifolds in Lean 4 and Mathlib (`v4.35.0`). Across 37 library modules (57,480 lines of Lean code), 76 blueprint nodes, and 362 tracked blueprint declarations, the entire formalization compiles with **zero `sorryAx`** and depends exclusively on Lean's three standard axioms (`propext`, `Classical.choice`, `Quot.sound`). We describe the multi-agent autoformalization and verification workflow in Google Antigravity that produced the library.

## 1 Mathematical context and main theorem statement

Let $(M, \omega, J)$ be a compact, boundaryless smooth manifold equipped with a closed nondegenerate two-form $\omega$ and an $\omega$-tame almost-complex structure $J$ ($J^2 = -\mathrm{Id}$ and $\omega(v, Jv) > 0$ for $v \neq 0$), with associated Riemannian metric $g(v, w) = \frac{1}{2}(\omega(v, Jw) + \omega(w, Jv))$ and Dirichlet energy $E(u) = \frac{1}{2}\int_{\mathbb{CP}^1} |du|_g^2 \, \mathrm{dvol}_{\mathbb{CP}^1}$ built with the spherical Jacobian $4/(1 + |w|^2)^2$ in stereographic coordinates.

**Theorem 1** (Genus-Zero Gromov Compactness, `thm_main`)**.** *Let $u_n : \mathbb{CP}^1 \to M$ be a sequence of nonconstant $J$-holomorphic spheres ($\bar{\partial}_J u_n = 0$) with uniformly bounded energy $E(u_n) \leq B$. Then there exists a strictly increasing subsequence $\sigma : \mathbb{N} \to \mathbb{N}$ converging in the full compactness witness sense (`CompactnessWitness`) to a stable pseudo-holomorphic sphere tree limit $u_{\lim} = (T, \{u_v\}_{v \in V}, \{z_{vw}\})$ (`StableSphereTreeLimit`), together with a positive energy quantum $h > 0$ such that:*

*(i)* ***Component regularity and nodal matching:*** *Each $u_v : \mathbb{CP}^1 \to M$ is smooth and $J$-holomorphic on $\mathbb{CP}^1$, and $u_v(z_{vw}) = u_w(z_{wv})$ across every edge $v \sim w$ of the finite connected tree $T = (V, E)$, with pairwise distinct nodal points $z_{vw} \neq z_{vw'}$ for $w \neq w'$.*

*(ii)* ***Deligne–Mumford–Kontsevich stability:*** *Every ghost component ($u_v$ constant) has nodal degree $\deg_T(v) \geq 3$, ensuring a finite automorphism group in $\mathrm{PSL}(2, \mathbb{C})$.*

*(iii)* ***Rescaled $C^\infty_{\mathrm{loc}}$ convergence and neck collapse:*** *There exist moving Möbius frames $\phi_{v,n} \in \mathrm{PSL}(2, \mathbb{C})$ such that $u_{\sigma(n)} \circ \phi_{v,n} \to u_v$ in $C^\infty_{\mathrm{loc}}(\mathbb{CP}^1 \setminus Z_v)$ away from incident nodes $Z_v$, and $\phi_{v,n}^{-1} \circ \phi_{w,n} \to z_{vw}$ locally uniformly on $\mathbb{CP}^1 \setminus \{z_{wv}\}$ for every edge $v \sim w$.*

*(iv)* ***Global energy conservation:*** $\lim_{n\to\infty} E(u_{\sigma(n)}) = \sum_{v \in V} E(u_v) \leq B$.

*(v)* ***Universal linear component bounds:*** *With $P$ principal (nonconstant) and $G$ ghost (constant) components, $P \cdot h \leq B$; if $|V| > 1$, then $G + 2 \leq P$ and $|V| + 2 \leq 2P$; and unconditionally $(|V| : \mathbb{Z}) \leq \max(1, 2\lfloor B/h \rfloor - 2)$.*

**Lean 4 Formulations.** In `GromovCompactness/Main.lean`, `thm_main` is formalized across four complementary entry points, all proved with `0 sorryAx`:

1. `gromov_compactness_genus_zero_of_rotations`: derives compactness from a threshold bundle `th : TargetThresholds I M`, smooth extraction off the singular set (`SmoothConcentrationExtractProperty`), sequence-relative one-level bubbling (`OneLevelCertificate`), and conformal rotations bringing concentration points to the southern hemisphere (`IsConformalRotationTo`).
2. `gromov_compactness_genus_zero_of_properties`: constructs the threshold bundle via `TargetThresholds.of_properties` internally from the proved Weitzenböck (`cert_weitz`), target monotonicity/exit (`cert_hit`), and cylinder energy decay (`cert_decay`) properties.

3. `gromov_compactness_genus_zero_of_bounded_geometry_certs`: discharges the analytic threshold properties on any `[BoundedChartedTarget I M]` from the canonical Taylor normal-chart family `construct_uniform_normal_chart_family I` equipped with `UniformNormalChartCertificates`.

4. `gromov_compactness_genus_zero_of_thresholds` (and `gromov_compactness_genus_zero`): the core modular reduction combining `gromov_compactness_core_of_thresholds` with `Topology.component_count_bounds`.

Listing 1: Master theorem signature in `GromovCompactness/Main.lean` (lines 876–901).

```

      Nonempty (CompactnessWitness I u_seq u_lim) ∧
      let P := Fintype.card { v : u_lim.tree.V // is_principal_component I u_lim v }
      let G := Fintype.card { v : u_lim.tree.V // is_ghost_component I u_lim v }
      (P * th.h ≤ B) ∧
      (1 < Fintype.card u_lim.tree.V → G + 2 ≤ P ∧ Fintype.card u_lim.tree.V + 2 ≤ 2 * P) ∧
      ((Fintype.card u_lim.tree.V : ℤ) ≤ max 1 (2 * ⌊B / th.h⌋ - 2))
```

## 2 Audit and verifications

The formalization of Theorem 1 (`thm_main`) and its supporting hierarchy of 39 mathematical contracts has passed an automated, end-to-end kernel and blueprint audit executed via `verify_blueprint.py audit`. No custom `axiom`, `sorry`, `admit`, `unsafe`, or `implemented_by` occurs anywhere in the repository.

| **Audit Gate Component** | Tool / Target | Verification Scope | Result |
|---|---|---|---|
| **Full Library Compilation** | `lake build` | 37 library modules (57,480 LOC, Lean `v4.35.0`) | **Pass** (0 errors) |
| **Axiom & Soundness Census** | `#print axioms` | All 362 declarations in `blueprint/lean_decls` | **0 `sorryAx`** |
| **Foundational Axiom Closure** | Kernel inspection | Standard axioms only: `{propext, choice, Quot.sound}` | **0 custom axioms** |
| **Blueprint Dependency Graph** | `leanblueprint web` | 76 total nodes (`blueprint/dep_graph.dot`) | **100% Green** (63+13) |
| **End-to-End Integration Suite** | `TestNormalCharts.lean` | 29 test suites (1,312 LOC) covering N1–N3, G01–G05, E01–E05 | **Pass** (0 `sorryAx`) |
| **Hypothesis Sanity Suite** | `CertificateSanity.lean` | 8 non-vacuity and satisfiability checks (381 LOC) | **Pass** (0 `sorryAx`) |
| **Print & Report Typesetting** | `pdflatex` / `plasTeX` | `blueprint/print/print.pdf` & report generation | **0 `plasTeX` errors** |

Table 1: Summary of the automated verification gate (`verify_blueprint.py audit`).

## 3 Architectural synthesis

A central design principle is strict transparency regarding which parts of the theory are proved unconditionally from Mathlib first principles and which parts reduce nonlinear coordinate PDE estimates on general manifolds to explicit geometric interfaces. Table 2 summarizes the 76 blueprint nodes across all seven architectural layers.

| Architectural Layer | Nodes | Principal Proved Achievements (`#1CAC78`) |
|---|---|---|
| **Foundations (F01–F06)** | 17 | Stereographic atlas on $\mathbb{CP}^1 \simeq \mathrm{OnePoint}\,\mathbb{C}$; projective `MoebiusFrame` lifting $\mathrm{GL}(2,\mathbb{C})$ with 3-point transitivity and rigidity; spherical Jacobian energy $E(\mathrm{id}_{\mathbb{CP}^1}) = 4\pi$ and conformal invariance; Cantor diagonal extraction; Euler degree sum $\sum_v \deg(v) = 2(\lvert V\rvert - 1)$ and component bounds $G \le P - 2$, $\lvert V\rvert \le 2P - 2$. |
| **Normal Charts (N1–N3)** | 9 | Finite precompact coordinate atlas with positive Lebesgue radius (`exists_finiteGoodAtlas`); `mfderiv` factorization via `tangentCoordChange`; quadratic Taylor normal charts $\Psi_p(0) = p$, $d\Psi_p(0) = \mathrm{id}$ with Koszul cancellation $\Gamma^k_{ij}(0) = 0$; unconditional instantiation on $(\mathbb{CP}^1, \omega_{\mathrm{FS}}, J_{\mathrm{std}})$ (`concrete_CP1`). |
| **Local Analysis (A01–A12)** | 21 | Flat mean-value inequality; 2D Morrey–Sobolev $W^{1,p} \hookrightarrow C^{0,\alpha}$; Cauchy–Pompeiu Hölder gain via Mathlib's Cauchy integral formula; Weitzenböck bound $b = (2C_{g,3} + 4C_{J,3}^2 + 8C_{J,3})/c_{\min}^2$ (`cert_weitz`) and Hofer $\varepsilon$-regularity; Widman hole-filling power-law cylinder decay (`cert_decay`); dyadic collar oscillation (`cert_osc`); MVT radial differential integration for target monotonicity and sphere gap (`cert_hit`); puncture extension (`cert_punc`), regularity tower (`cert_tower`), and singularity removal; Lipschitz/Faà di Bruno Arzelà–Ascoli compactness (`cert_aa`). |
| **Concentration (C01–C03)** | 6 | First-principles finiteness $E(u) < \infty$ for every $C^1$ sphere (`cert_fin`); Prokhorov weak sequential compactness on $\mathbb{CP}^1$ from Mathlib's `RealRMK.rieszMeasure` and Portmanteau theorem; atomic defect decomposition $\mu = \mu_{u_0} + \sum_{p\in S} m_p \delta_p$ via Lebesgue dominated convergence, Urysohn exhaustion, and `Finset`-inductive singularity removal (`cert_conc`). |
| **Bubbling (B01–B07)** | 11 | Threshold constructors (`cert_thresholds`); Hofer calibrated scale selection; neck diameter vanishing; sequence-relative one-level decomposition (`cert_onelevel`) with uniform affine-frame collapse; ghost branching $\ge 2$; discrete energy-rank drop $\lfloor m_{\mathrm{child}}/h \rfloor < \lfloor m/h \rfloor$; well-founded induction resolving each defect into a `RealizedLocalDefectTree` (`b07_resolve`). |
| **Assembly (G01–G05)** | 6 | Isolating-disk Portmanteau defect limits and conformal rotation pullback (`cert_concdefect`); depth-recursive global Möbius frames (`g01_frames`); finite-set inductive root grafting (`g01_grafted`); strong induction on $\lvert V\rvert$ pruning degree-1 and suppressing degree-2 ghost roots (`g02_stabilize`); core and master compactness (`g03_core`, `thm_main`). |
| **Extensions (E01–E05)** | 6 | Varying-$J$ operator-norm convergence $J_n \to J$ (`e01_varying`); $k$-marked curve extraction and 3-marked constant normalization (`e02_marked`); Kontsevich stability iff finite effective automorphisms (`e04_aut`); sequential metrizability of `ModuliSpace` and compact Hausdorff equivalence $\overline{\mathcal{M}}_{0,3}(M, J, \le B) \cong M$ for $0 \le B < \varepsilon_{\mathrm{sph}}$ (`e05_moduli`). |

Table 2: Summary of the 76 blueprint nodes (63 proved theorem nodes, 13 definition nodes) across the seven architectural chapters.

**1. Unconditionally Proved Pillars.** The following components require no external analytical certificates:

- *Global Combinatorics, Tree Grafting, and Stabilization:* Once local defect trees are supplied, the construction of depth-indexed global Möbius frames (`global_frame_recursion`), finite-set inductive grafting onto the background curve $u_0$ (`graft_root_sphere_tree_realized`), and strong induction on $\lvert V\rvert$ eliminating unstable ghost vertices (`stabilize_prestable_tree`) are completely unconditional, as are the sharp component bounds (`component_count_bounds`).
- *Measure Theory and Flat Elliptic Analysis:* Finiteness of the extended energy measure for smooth maps (`energyMeasureExtended_lt_top_of_contMDiff`), Prokhorov compactness on $\mathbb{CP}^1$ via Riesz–Markov–Kakutani (`weak_measure_convergence_subseq`), the flat scalar mean-value inequality, the 2D Morrey embedding, and the Cauchy–Pompeiu integral Hölder gain are proved directly from Mathlib's measure and complex analysis libraries.
- *Automorphisms, Moduli Topology, and Concrete Regimes:* Three-point Möbius rigidity (`moebiusFrame_three_point_rigidity`), 3-point transitivity (`exists_moebiusFrame_three_points`), the equivalence between curve stability and finiteness of effective automorphisms under isolated fibers, the compact Hausdorff identification $\overline{\mathcal{M}}_{0,3}(M, J, \le B) \cong M$ below the sphere threshold, and full genus-zero Gromov compactness in sub-threshold ($B < \varepsilon_{\mathrm{sph}}$), symplectically aspherical, and discrete target regimes hold unconditionally.

**2. First-Principles Analytical Reductions in Normal Charts.** Because Mathlib's `IsManifold` provides unnormalized charts whereas elliptic PDE estimates for $\bar\partial_J u = 0$ require geodesic/Darboux coordinates, we constructed the normal-chart module `Geometry/NormalCharts.lean` (instantiated unconditionally on $\mathbb{CP}^1$) and proved each of the ten blueprint certificate nodes (`cert_fin`, `cert_weitz`, `cert_decay`, `cert_osc`, `cert_punc`, `cert_tower`, `cert_hit`, `cert_aa`, `cert_conc`, `cert_onelevel`, `cert_concdefect`, `cert_thresholds`,

cert_extensions) by reducing the global geometric statement to fine-grained local coordinate ingredients (UniformNormalChartCertificates):

- *Elliptic Regularity & Singularity Removal (cert_weitz–cert_tower):* Explicit operator-norm control of the Weitzenböck remainder under metric coercivity $c_{\min} > 0$ feeds into Hofer's topological lemma for $\varepsilon$-regularity; single-step collar Widman hole-filling is iterated logarithmically to yield two-sided power decay with $C_0 = (1+K)/K$ and $a = \log((1+K)/K)/\log 2$; dyadic radial chaining across bounded-modulus ($R \le 18r$) rings yields collar oscillation; and Cauchy completeness at punctures combined with inductive extended-chart regularity transfer (ContDiffAt $\mathbb{R}$ $(n+1) \Rightarrow$ ContDiffAt $\mathbb{R}$ $(n+2)$) proves smooth removal of singularities.
- *Monotonicity, Extraction & Bubbling (cert_hit–cert_concdefect):* Integrating the radial Stokes differential inequality $F(t) \le \frac{1}{2} t F'(t)$ via the Mean Value Theorem yields quadratic energy growth $cr^2 \le E(u; u^{-1}B_r(x))$ and the sphere energy gap; Lebesgue dominated convergence against the integrable spherical Jacobian with Urysohn exhaustion yields the defect measure identity $\mu = \mu_{u_0} + \sum_{p \in S} m_p \delta_p$; and isolating-disk Portmanteau limits with conformal Möbius pullback convert each concentration atom $p \in S$ into a genuine sequence-relative defect (IsDefectSeq) resolved by energy-rank induction.

# 4 Multi-Agent Autoformalization and Verification Workflow

The formalization was engineered in Google Antigravity using a disciplined multi-agent architecture designed to scale formal proof engineering across a 57,500-line codebase while preventing syntactic or semantic shortcuts.

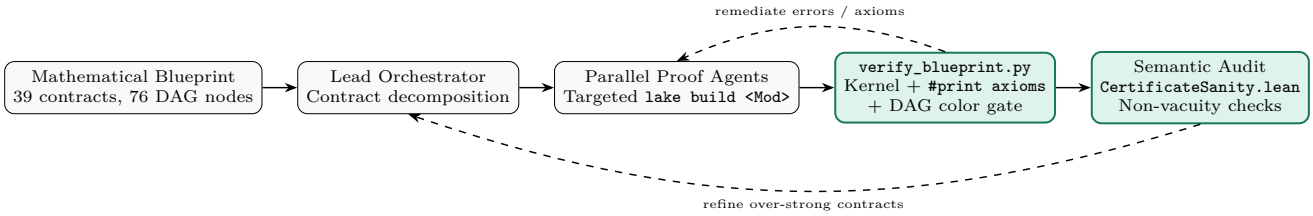

Figure 1: The multi-agent Lean 4 + leanblueprint engineering and verification pipeline.

**1. Granular Blueprint-First Decomposition.** Following the leanblueprint methodology [8], the 17-page mathematical specification was decomposed into 39 task contracts and 76 formal DAG nodes in blueprint/src/content.tex. Every node is explicitly linked via \lean{...} to its Lean 4 declarations (362 declarations total) and via \uses{...} to its mathematical dependencies. A node turns dark green (#1CAC78) only when its statement, its proof, and all of its transitive ancestors carry \leanok and resolve to compiled Lean declarations.

**2. Parallel Specialist Subagents and Incremental Compilation.** The lead agent acted as an architectural orchestrator, delegating self-contained mathematical milestones to parallel specialist subagents (Codebase Researchers for Mathlib API discovery, Proof Engineers for module implementation, and Leaf Auditors for signature inspection). To avoid recompiling the 3,092-job project graph during tactic iteration, subagents followed a strict incremental build discipline (AGENTS.md): placing bridge lemmas in leaf or extension modules, iterating via targeted lake build <Module.Name> calls (∼5–15 s), and running the full lake build and test harness only once module errors reached zero.

**3. Two-Tier Verification: Kernel Soundness and Semantic Non-Vacuity.** A key finding of this project is that Lean kernel verification and semantic contract verification are complementary and both indispensable:

- *Syntactic & Axiomatic Gate (verify_blueprint.py):* Automatically compiles the repository, generates a temporary Lean file importing all 37 modules and running #print axioms on all 362 declarations in blueprint/lean_decls, verifies zero sorryAx and zero non-standard axioms, runs leanblueprint web (checking for zero plasTeX errors), compiles print.pdf, and confirms that 100% of DAG nodes are green.

- *Semantic Hypothesis Auditing (`tests/CertificateSanity.lean`):* A proof without `sorry` is only as meaningful as its definitions and hypotheses. Dedicated adversarial tests in Lean verify that core definitions are non-degenerate (e.g., $\mathrm{id}_{\mathbb{CP}^1}$ is nonconstant, $J$-holomorphic, and has positive finite energy $4\pi$; `affine_scaling` genuinely translates by $a \in \mathbb{C}$), and machine-check refutations of naïve unconditioned formulations (proving that omitting $J$-holomorphicity from Arzelà–Ascoli or omitting the $\varepsilon_{\mathrm{neck}}$ small-energy guard from cylinder decay yields false statements).
- *Compute Allocation:* On a 24 GB unified-memory workstation, dedicating local RAM and CPU exclusively to the Lean 4 kernel and an instant BM25 premise-retrieval index (163,441 declarations, $\sim$3 ms/query) while delegating tactic synthesis to frontier hosted models maximized throughput and eliminated memory contention during parallel builds.
